Defender Series Spring Nuts

(4) End Caps

Compatible with Starlink

With unrivaled strength and durability, SataMount™ is a universal fit solution for attaching satellite dishes on standing seam roofs. A satellite dish is merely shown for illustration and is not actually included. This system works with Starlink. Additionally, SataMount™ works well for installing conduits, solar micro inverters, electrical junction boxes, and just about everything else that has to be mounted to a standing seam metal roof.

The SataMount system is an exciting choice for homeowners, building owners, contractors, and satellite businesses alike because the RoofClamp is made to suit around 95% of the standing seam roofs that are currently in use. Thanks to its flexible design and precise manufacturing, it fits securely and seamlessly on a variety of standing seam roofs, eliminating the need for product modifications.

The SataMount™ ensures a durable and dependable satellite dish mounting option by withstanding even the worst weather conditions. Defender-coated P1000T 27" Unistruts can support 1,690 pounds per strut and work with standing seam metal panels spaced up to 24".

Four aluminum RoofClamp RCT clamps, two 27-inch Unistrut sections with a 100-year service life Defender finish, Defender-coated spring nut channel bolts, and 304 stainless steel screws and washers make up this system.
